## **CLASSIFICATION OF ECONOMIC INFORMATION SYSTEMS**

Modern conditions of the development of the economy expects the active use of information technologies that meet the information needs of management, production, supply, trade, sales and other functional divisions of enterprises. Information technology allows to manage effectively all types of resources in the enterprise.

Theoretical and practical issues of information systems implementation in various areas of enterprise activity are explored by many scientists, such as: T. Shmatkovska [1], A. Pylypenko, O. Popov [2], M. Sharko, J. Burenko, N. Gusarina [3] and others.

The purpose of the research is to determine the types of the classification of economic information systems.

An economic information system is a set of internal and external flows of direct and indirect data communication of an economic object, methods, means, specialists involved in the information process and the development of decision-making process.

The classification of economic information systems is presented in fig. 1.

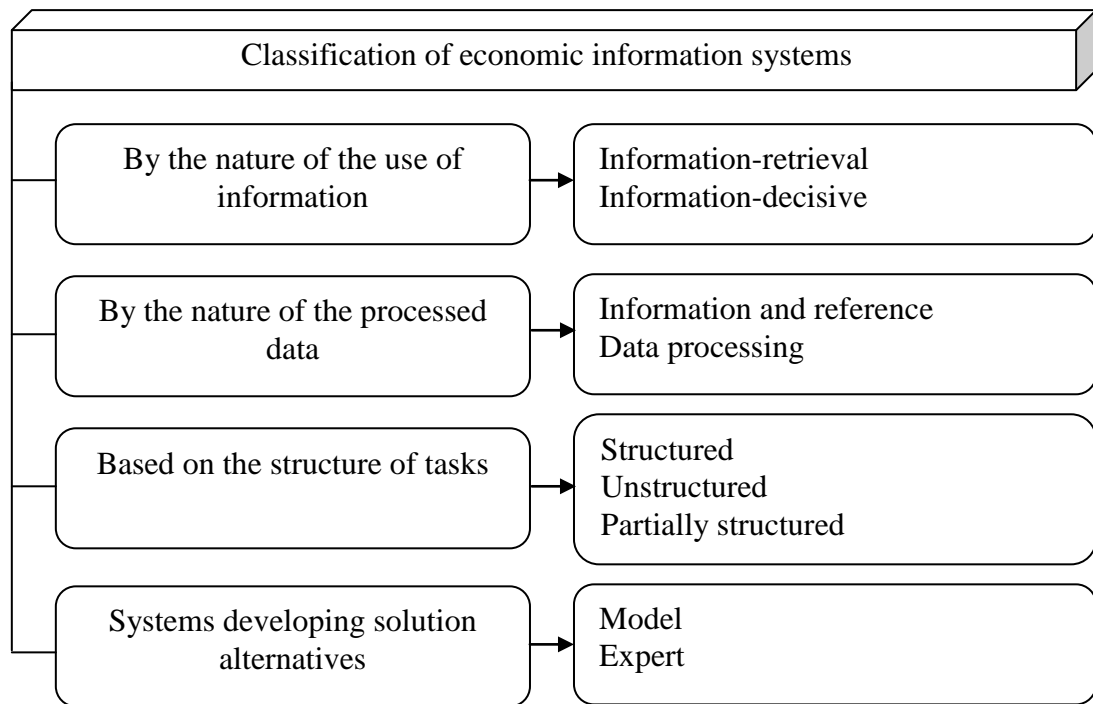

Figure 1 – Classification of economic information systems

Source: authors' creation based on [1-3]

The widespread use of computer technology makes it possible to increase the efficiency of decision-making at an enterprise. Thus, the paper presents the main features of the classification of economic information systems.
